

Incident report analysis

Summary	Today the organization's network service suddenly stopped responding due to an incoming flood of ICMP packets. The incident management team responded by blocking incoming ICMP packets, stopping all non-critical network services offline, and restoring critical network services. The company's cybersecurity team then investigated the security event. They found that a malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall. This vulnerability allowed the malicious attacker to overwhelm the company's network through a distributed denial of service (DDoS) attack.
Identify	The team investigated the event and found that a malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall. This vulnerability allowed the malicious attacker to overwhelm the company's network through a DDoS attack. All critical network resources needed to be secured and restored to a functioning state.
Protect	To address this security event, the network security team implemented: a new firewall rule to limit the rate of incoming ICMP packets and an IDS/IPS system to filter out some ICMP traffic based on suspicious characteristics.
Detect	To detect new unauthorized access attacks in the future, the team will use a network monitoring software to detect abnormal traffic patterns and a source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets.

Respond	We informed the team to keep up with baseline configurations and firewall maintenance to limit further vulnerabilities from the network. The incident management team responded by blocking incoming ICMP packets, stopping all non-critical network services offline, and restoring critical network services.
Recover	The incident management team blocked incoming ICMP packets, stopping all non-critical network services offline, and restoring critical network services. The security team then configured the company's network by making a new firewall rule to limit the rate of incoming ICMP packets and also added source IP verification to check for spoofed IP addresses on incoming ICMP packets.
